The invention relates to a novel composition comprising a substance that modulates the status of a 1519304 protein (e.g. 1519304 variant 1-11; or a melecule that is modulated by the 1519304 protein, where the status of a cell that expresses the 1519304 protein is modulated. The novel compositions, or the 1519304 protein and genes, are useful for eliciting a humoural or cellular immune response. The 1519304 genes and proteins are also useful for diagnosing, prognosing, preventing or treating cancer, e.g. adenocarcinoma, bladder cancer, colorectal cancer, lung or bronchial cancer, breast cancer or carcinoma. This sequence represents a human leukocyte antigen peptide relating to the 1519304 composition of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New 151P3D4 proteins and genes, useful for eliciting a humoral or cellular immune response, or for diagnosing, prognosing, preventing or treating cancer, e.g. adenocarcinoma, bladder cancer, lung, breast cancer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel composition comprising a substance that modulates the status of a 151P3D4 protein (e.g. 151P3D4 variant 1-11; or a molecule that is modulated by the 151P3D4 protein, where the status of a cell that expresses the 151P3D4 protein is modulated. The novel compositions, or the 151P3D4 proteins and genes, are useful for eliciting a humoural or cellular immune response. The 151P3D4 genes and proteins are also useful for diagnosing, prognosing, preventing or treating cancer, e.g. adenocarcinoma, bladder cancer, colorectal cancer, lung or bronchial cancer, breast cancer or carcinoma. This sequence represents a human leukocyte antigen peptide relating to the 151P3D4 composition of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New 151P3D4 proteins and genes, useful for eliciting a humoral or cellular immune response, or for diagnosing, prognosing, preventing or treating cancer, e.g. adenocarcinoma, bladder cancer, lung, breast cancer

```
The invention relates to a novel composition comprising a substance that modulates the status of a 151P3D4 protein (e.g. 151P3D4 variant 1-11; or a molecule that is modulated by the 151P3D4 protein, where the status of a cell that expresses the 151P3D4 protein is modulated. The novel compositions, or the 151P3D4 protein and genes, are useful for eliciting a humoural or cellular immune response. The 151P3D4 genes and proteins are also useful for diagnosing, prognosing, preventing or treating cancer, e.g. adenocarcinoma, bladder cancer, colorectal cancer, lung or bronchial cancer, breast cancer or carcinoma. This sequence represents a human leukocyte antigen peptide relating to the 151P3D4 composition of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New 151P3D4 proteins and genes, useful for eliciting a humoral or cellular immune response, or for diagnosing, prognosing, preventing or treating cancer, e.g. adenocarcinoma, bladder cancer, lung, breast cancer
                                                                                                                    New 151P3D4 proteins and genes, useful for eliciting a humoral or cellular immune response, or for diagnosing, prognosing, preventing or treating cancer, e.g. adenocarcinoma, bladder cancer, lung, breast cancer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel composition comprising a substance that modulates the status of a 151P3D4 protein (e.g. 151P3D4 variant 1-11; or a molecule that is modulated by the 151P3D4 protein, where the status of a cell that expresses the 151P3D4 protein is modulated. The novel compositions, or the 151P3D4 proteins and genes, are useful for eliciting a humoural or cellular immune response. The 151P3D4 genes and proteins are also useful for diagnosing, prognosing, preventing or treating cancer, e.g. adenocarcinoma, bladear cancer, colorectal cancer, lung or bronchial cancer, breast cancer or carcinoma. This sequence represents a human leukocyte antigen peptide relating to the 151P3D4 composition of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Cytostatic; gene therapy; vaccine; modulator; 151P3D4; humoural; cancer; cellular immune response; adenocarcinoma; bladder; colorectal; lung; bronchial; breast; carcinoma; human leukocyte antigen; HLA.

The novel compositions, or the 151P3D4 proteins and genes, are useful for eliciting a humoural or cellular immune response. The 151P3D4 genes and proteins are also useful for diagnosing, prognosing, preventing or treating cancer, e.g. adenocarcinoma, bladder cancer, colorectal cancer, lung or bronchial cancer, breast cancer or carcinoma. This sequence represents a 151P3D4 related peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New 151P3D4 proteins and genes, useful for eliciting a humoral or cellular immune response, or for diagnosing, prognosing, preventing or treating cancer, e.g. adenocarcinoma, bladder cancer, lung, breast cancer or carcinoma.
                   The invention relates to a novel composition comprising a substance that modulates the status of a 151P3D4 protein (e.g. 151P3D4 variant 1-11; or a molecule that is modulated by the 151P3D4 protein, where the status of a cell that expresses the 151P3D4 protein is modulated. The novel compositions, or the 151P3D4 proteins and genes, are useful for eliciting a humoural or cellular immune response. The 151P3D4 genes and proteins are also useful for diagnosing, prognosing, preventing or treating cancer, e.g. adenocarcinoma, bladder cancer, colorectal cancer, lung or bronchial cancer, breast cancer or carcinoma. This sequence represents a 151P3D4 related peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Cytostatic; gene therapy; vaccine; modulator; 15193D4; humoural; cancer; cellular immune response; adenocarcinoma; bladder; colorectal; lung;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel composition comprising a substance that modulates the status of a 151934 protein (e.g. 1519304 variant 1-11; or a molecule that is modulated by the 1519304 protein, where the status of a cell that expresses the 151934 protein is modulated. The novel compositions, or the 151934 protein and genes, are useful for eliciting a humoural or cellular immune response. The 1519304 genes and proteins are also useful for diagnosing, prognosing, preventing or treating cancer, e.g. adenocarcinoma, bladder cancer, colorectal cancer, lung or bronchial cancer, breast cancer or carcinoma. This sequence represents a human leukocyte antigen peptide relating to the 1519304 composition of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cancer
                                                                                                                                                                                                                                                                                                                                                                                                                       Cytostatic; gene therapy; vaccine; modulator; 151P3D4; humoural; cancer; cellular immune response; adenocarcinoma; bladder; colorectal; lung; bronchial; breast; carcinoma; human leukocyte antigen; HLA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel composition comprising a substance that modulates the status of a 151P3D4 protein (e.g. 151P3D4 variant 1-11; or a molecule that is modulated by the 151P3D4 protein, where the status of a cell that expresses the 151P3D4 protein is modulated. The novel compositions, or the 151P3D4 proteins and genes, are useful for eliciting a humoural or cellular immune response. The 151P3D4 genes and proteins are also useful for diagnosing, prognosing, preventing or treating cancer, e.g. adenocarcinoma, bladder cancer, colorectal cancer, lung or bronchial cancer, breast cancer or carcinoma. This sequence represents a 151P3D4 related peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New 151P3D4 proteins and genes, useful for eliciting a humoral or cellular immune response, or for diagnosing, prognosing, preventing or treating cancer, e.g. adenocarcinoma, bladder cancer, lung, breast cancer
                                                                                                                                                          Cytostatic; gene therapy; vaccine; modulator; 151P3D4; humoural; cancer; cellular immune response; adenocarcinoma; bladder; colorectal; lung; bronchial; breast; carcinoma.

ö
The invention relates to a novel composition comprising a substance that modulates the status of a 1519304 protein (e.g. 1519304 variant 1-11; or an election that expresses the 1519304 protein; where the status of a cell that expresses the 1519304 protein is modulated. The novel compositions, or the 1519304 protein and genes, are useful for eliciting a humoural or cellular immune response. The 1519304 genes and proteins are also useful for diagnosing, proynosing, preventing or treating cancer, e.g. adenocarcinoma, bladder cancer, colorectal cancer, hung or bronchial cancer, breast cancer or carcinoma. This sequence represents a human leukocyte antigen peptide relating to the 1519304 composition of

"Distinct sequence of gonadotropin-releasing hormone (GnRH) in dogfish brain provides insight into GnRH evolution.";
Proc. Natl. Acad. Sci. U.S.A. 89:6373-6377 (1992).
-! FRNCTION: Stimulates the secretion of gonadotropins.
-! SUBCELLULAR LOCATION: Secreted.
-! SIMILARITY: Belongs to the GnRH family.

Biol. Chem. Hoppe-Seyler 373:133-142(1992).

cardiaca after the beginning of firom cells in the corpora cardiaca after the beginning of flight, causes release of diglycerides from the fat body and then stimulates the flight conscient to use these diglycerides as an energy source.

-!- SUBCELLUIAR LOCATION: Secreted.
-!- SIMILARITY: Belongs to the AKH / HRTH / RPCH family.

28-FEB-2003 (Rel. 41, Last annotation update)
Cytochrome c oxidase polypeptide VIIc, mitochondrial (EC 1.9.3.1)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Toxicon 40.401.407 (2002).
-!- FUNCTION: Causes hyperactivity in mice.
-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Expressed by the venom duct.
-!- MASS SPECTROMETRY: Wm=1454.8; WETHOD=Electrospray.
-!- SIMILARITY: Belongs to the FARP (FMRFamide related peptide)
                                                                                                                                                                                                                                                                                                                                                                       Conus spurius (Alphabet cone).

-!- FUNCTION: SMOOTH MUSCLE CONTRACTION. PROBABLY PLAYS A ROLE FOR THIS SYSTEM IN CARDIOVASCULAR REGULATION IN FISH.
-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Plasma.
-!- SIMILARITY: Belongs to the bradykinin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Oncorpynchus mykiss (Rainbow trout) (Salmo gairdneri).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Biol. Chem. Hoppe-Seyler 371:475-483(1990).

-!- FUNCTION: This hormone, released from cells in the corpora cardiaca after the beginning of flight, causes release of diglycerides from the fat body and then stimulates the flight muscles to use these diglycerides as an energy source.
-!- SUNCELLULAR LOCATION: Secreted.
-!- SIMILARITY: Belongs to the AXH / HRTH / RPCH family.
PIR, $10596; $10596.

-!- CATALYTIC ACTIVITY: NADH + ubiquinone = NAD(+) + ubiquinol.
-!- CATALYTIC ACTIVITY: NADH + acceptor = NAD(+) + reduced acceptor.
-!- COPACTOR: Binds 1 FAD per subunit.
-!- SUBUNIT: Mammalian complex I is composed of 45 different subunits.
This a component of the hydrophobic protein fraction.
-!- SUBCELLULAR LOCATION: Mitochondrial matrix.

I. FUNCTION: Hypertrehalosaemic factors are neuropeptides that
major carbohydrate in the hemolymph of insects).

C. I. SUBCELLULAR LOCATION: Secreted.
II. MASS SPECTROMETRY: MW=1308.61; METHOD=FAB.

C. I. STMILLARITY: Belongs to the AKH / HRTH / RPCH family.

AUSTRALIAN Tree frog Littoria xanthomera.";
J. Pept. Sci. 3:181-185(1997).
-!- FUNCTION: Hypotensive neuropeptide.
-!- SUBCELLUIAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Skin dorsal glands.
-!- MASS SPECIFICITY: M*=1354; METHOD=FAB.
-!- SIMILARITY: Belongs to the gastrin/cholecystokinin family.

"Initiation Elophys. Res. Commun. 225:1052-1057 (1996).

"Initiation a ternary complex with GTP and initiator tRNA. This complex binds to a 40s ribosomal subunit, followed by mRNA binding to form a 438 preinitiation complex. Junction of the 60s ribosomal subunit to form the 80s initiation complex is preceded by hydrolysis of the GTP bound to eIF-2 and release of an eIF-2-GDP binary complex. In order for eIF-2 and release of an eIF-2-GDP binary complex. In order for eIF-2 to recycle and catalyze another round of initiation, the GDP bound to eIF-2 must exchange with GTP by way of a reaction catalyzed by eIF-2b.

"SUBUNIT: Heterotrimer composed of an alpha, a beta and a gamma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

J. Biochem. 1941871-877 (1990).

-!- FUNCTION: Reduction of methyl-coenzyme M (2-(methylthio) ethanesulfonic acid) with 7-mercaptoheptanoylthreonine phosphate to methane and an hetrodistilide.

-!- CATALYTIC ACTIVITY: CH(3)-S-COM + H-S-HTP = CH(4) + COM-S-S-HTP.

-!- COFACTOR: Binds 2 coenzyme F430 noncovalently per hexamer.

Coenzyme F430 is a yellow nickel porphinoid.
-!- PATHWAY: Methanogenesis; last step.
-!- SUBUNIT: Hexamer of two alpha, two beta, and two gamma chains.
-!- DEVELOPMENTAL STRAGE: THERE ARE TWO MCR COMPLEXES IN THIS BACTERIA.
MCR II IS EXPRESSED IN THE BARLY GROWTH PHASE. LATE GROWTH CELLS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

"Characterization of a new inhibitor for angiotensin converting
enzyme from the venom of Vipera aspis aspis.";
Int. J. Biochem. 22:767-771 (1990).
-!- FUNCTION: This peptide both inhibits the activity of the
angiotensin-converting enzyme and enhances the action of
bradykinin by inhibiting the kinases that inactivate it.
It acts as an indirect hypotensive agent.
                                                                                                                                                                                                                                                                                                                                                                                                   ·

An unusual combination of peptides from the skin glands of Ewing's tree frog, Litoria ewing: Sequence determination and antimicrobial activity.";
Aust. J. Chem. 50:889-894(1997)
-!- FUNCTION: Uperin 7.1 shows antibacterial activity against L.lactis and S.uberis. Uperin 7.1.1 is inactive.
-!- SUBCELDUAR LOCATION: Secreted.
-!- TISSUE SPECTIFICITY: Expressed by the skin dorsal glands.
-!- MASS SPECTROMETRY: WM-1184?; METHOD=FAB; RANGE=1-13.
-!- MASS SPECTROMETRY: WM-1184; METHOD=FAB; RANGE=1-13.

Cintra A.C.O., Vieira C.A., Giglio J.R.;
J. Protein Chem. 9:221-227(1990).
-!- FUNCTION: This peptide both inhibits the activity of the angiotensin-converting enzyme and enhances the action of bradykinin by inhibiting the kinases that inactivate it.
It acts as an indirect hypotensive agent.
PIR; A01253; XAV13B.
Hypotensive agent; Pyrrolidone carboxylic acid.
MOD RES.
1 PRRROLIDONE CARBOXYLIC ACID.
